

Routing and Controllers

1. Create a model Product with 2 fields (name and sku)
2. Create a controller as a service
 - To display single product details from url, for example /product/5A/Mobile Phone
 - Controller should contain single action, apply twig to constructor, and render the single template with the Product details
 - After product details it should render the link to Brands listing page at management console
3. Create controller BrandController that extends AbstractController
 - indexAction with route /brands/{count}, should render from 1 to 50 brands (\Oro\Bundle\ProductBundle\Entity\Brand) from the database
 - When count not provided - render 10 brands
 - Write to log how many brands was requested
4. Replace built-in Oro\Bundle\ProductBundle\Controller\BrandController::indexAction with the new controller
 - Check that link from product view page leads to new controller
