

Twig, Translations and Expression Language

1. Change the label of the “Middle Name” for Customer User to “Second Name” with translations
2. Override twig template from core for the registration form to move “Second Name” field after the “First Name”
 - Tip: You will need layout update with `@setFormTheme` action for that purpose
3. Create twig extension that will add custom function named “todayIsThursday”
 - that will write “tomorrow is Friday” if it is Thursday, and on other days it will write, “not yet”.
 - Use this function at the home page to render the message just after the logo
4. (advanced) Create layout update file for the home page that will render current date at the footer
 - Tip: this require custom expression language function or layout data provider (second option is simpler)
5. (optional) Create twig macros that will apply CustomerUser entity as an argument
 - and render all the CustomerUser fields
 - Use this macros to add user information at the top and at the Customer User View and Edit pages at the Admin.
