

Dependency Injection and Events

1. Decorate \Oro\Bundle\CatalogBundle\Layout\DataProvider\FeaturedCategoriesProvider service to always return maximum 4 categories
2. Make it possible to use \Oro\Bundle\ProductBundle\Rounding\QuantityRoundingService for autowiring.
3. Use QuantityRoundingService inside the new controller action “roundAction” with the route **/round/{precision}** to round the float number 88888.88888 down to the precision from route placeholder and render the result.

88888.888

a.

4. At the “roundAction” dispatch an event **RoundingEvent** before rendering value, event should allows developer to modify the result of calculation with listeners.
5. Register a listener to **RoundingEvent** that will add 0.22 to the result number
