

High level project architecture

1. Create a bundle “AppBundle” that will be loaded the last
 - a. Bundle should contain a simple controller that renders “Hello World!”
 - b. Controller should be loaded with the route that match /hello-world path
2. On each request write User IP address and the page he visited to log with level “info”,
 - a. in case it's previously created controller - do nothing
3. Create one more controller outside of a bundle, at src/Controller
 - a. the controller should contain one action with the route /hello-symfony and render “Hello Symfony!”
4. (optional) Install with composer external bundles
 - a. oro/commerce-authorizenet
 - b. oro/twig-inspector
